ZACRP4 protein has two complement factor C1q domains. The ZACRP4 gene is located on human chromosome 11q11. The ZACRP4 coding sequence and protein have a number of uses described in the specification, including, modulatation of energy balance and cellular metabolic reactions in mammals. In addition, ZACRP4 protein is useful as an autocrine factor, particularly during development, in mediating the processes of an organism, in regulating cellular processes such as cell proliferation and/or differentiation, cell survival and energy balance.

                                                                                                                                                                                                                                                                                   CC anti-SECP antibody, and screening for antiagonists and modulators of CC SECP function or expression. The SECP proteins and nucleic acids are CC useful in the diagnosis, treatment and prevention of cell proliferative CC (e.g. actinic keratosis, arteriosclerosis, burstis, hepatitis or CC cancer), autoimmune/inflammatory (e.g. AIDS (acquired immunodeficiency CC syndrome), asthma, anaemia, allergies or atopic dermatitis), CC cardiovascular (e.g. congestive heart failure, ischaemic heart disease, CC myocardial infarction, hypertensive heart disease, or Alzheimer's CC meurological (e.g. epilepsy, stroke, cerebral meoplasms, or Alzheimer's CC disease), and developmental (e.g. renal tubular acidosis, Cushing's CC disease), and developmental (e.g. renal tubular acidosis, Cushing's CC specification. These may also be used in assessing the effects of CC exogenous compounds on the expression of nucleic acid and amino acid CC sequences of the secreted proteins. The present sequence represents a compounds of the invention of the invention

                                                                                                                                                                                               The present invention relates to new NOVX polypeptides. The invention is useful for treating or preventing a NOVX-associated disorder such as cardiomyopathy or atherosclerosis, where the disorder is related to cell signal processing and metabolic pathway modulation in a subject, preferably human. The invention is also useful for treating metabolic disorders (e.g. obesity), diabetes, infectious disease, neurodegenerative disorders, haematopoietic disorders and various cancers. The molecules of the invention are also useful for treating cirrhosis, pancreatitis, learning and menory defects, infertility, congenital heart defects, anne, hair growth, pigmentation disorders, endocrine disorders, respiratory disease, gastro-intestinal diseases, reproductive, health, neurological diseases, bone marrow transplantation, endocrine diseases,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gangolli

useful for treating or preventing a NOVX-associated disorder such as cardiomyopathy or atherosclerosis, where the disorder is related to cell signal processing and metabolic pathway modulation in a subject, preferably human. The invention is also useful for treating metabolic disorders (e.g. ablesity), diabetes, infectious disease, neurone disorders (e.g. Alzheimer's disease, parkingon's disease), immune disorders, haematopoietic disorders and various cancers. The molecules of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       haematopoietic disorder; cirrhosis; pancreatitis; learning defect; memory defect; infertility; congenital heart defect; hair growth; pigmentation disorder; endocrine disorder; respiratory disease; health; gastro-intestinal disease; reproductive; neurological disease; bone marrow transplantation; endocrine disease; allergy; inflammation; nephrological disorder; urinary system disorder; age-related disorder; neuropsychiatric disorder; EGF-related procein; SCUBEI; TEN-M4; adipocyte complement-related C1q tumour necrosis factor; out at first; beta adrenergic receptor kinase; EphA6/ehk-2; glucose transporter; type la membrane sushi-containing domain; butyrophilin;
                                                                                                                                                                                               Novel isolated NOVX polypeptide useful for treating cardiomyopathy, atherosclerosis, metabolic disorders, diabetes, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease
                                                                                                               The present invention relates to new NOVX polypeptides. The invention

Claim 20; Page 214-215; 1963pp; English

CC haematopoiesis regulatory activity; tissue growth activity; chemotactic or chemokinetic activity: activity is haematopoiesis; concert chemotactic or chemokinetic activities; haemostatic, thrombotic or chemotactic or conditions on their biological activities, polypeptides and nucleotides of conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., asthematory conditions (e.g., myeloid or lymphoid cell conditions), chronic inflammatory conditions (e.g., asthma or arthritis), cronic inflammatory conditions (e.g., asthma or arthritis), confict ative retinopathy, atherosclerosis, coronary heart disease, coronary heart or activities may be used to promote wound conditions (e.g., of burns, incisions and ulcers), while those with conditions (e.g., of burns, incisions and ulcers), while those with conditions of the same to promote wound conditions and the promote wound conditions and ulcers), while those with conditions and ulcers) and another to replace cell such as the conditions of the can be used to augment or replace cells damaged by illness, and in the diagnosis of the above conditions, and in drug also be used in the diagnosis of the above conditions, and in man or the processor expenses a novel human conditions. or polypeptides in a sample, and methods of identifying compounds which bind to polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention in have various activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity. Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides in a sample, and methods of identifying compounds which bind to not produced the first sample, and methods of identifying compounds which bind to not produced the novel polypeptides. Sequence polypeptide techniques. The present sequence represents a novel human 127 of the invention Ŗ cell may

Sequence 44, Application US/09118408A
Patent No. 626544
GENERAL INFORMATION:
APPLICANT: Sheppard, Paul O.
TITLE OF INVENTION: ADIPOCYTE-SPECIFIC PROTEIN HOMOLOGS
FILE REFERENCE: 97-30
CURRENT APPLICATION NUMBER: US/09/118,408A

RESULT 2 US-09-118-408-44

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

C;Comment: The first component of complement is a calcium-dependent complex of the three ivation of Clr (enzyme), Cls (proenzyme), and the other eight components of complement.
C;Comment: The Clq subcomponent is composed of nine subunits, six of which are disulfide (see pIR:C1HUQC) chain. Equimolar amounts of the A, B, and C chains are found after redu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A; Molecule type: protein
